Translation

Translation converts a sequence of text from one language to another.

Demo Code

We provide example usage of the Skywork reward model series below. Please note that:

1. We removed the BOS token from the chat templates of the two models to prevent it being applied to the `apply_chat_template` to add the BOS token.
2. To enable optimal performance for the 27B reward model, ensure that you have enabled `torch_dtype=torch.float16` that could significantly degrade the model's performance for this particular model.

Below is an example of obtaining the reward scores of two conversations.

```
import torch

from transformers import AutoModelForSequenceClassification, AutoTokenizer

# Load model and tokenizer
device = "cuda:0"
```

```
import torch
from transformers
import ...
```

```
def
compute_seed_score
(...):
...
```
